## 1. Notes regarding queries

- Query A, B and C: we did not select DISTINCT boat names because different boats (with distinct (country\_name, cin)) might have the same name, since the name is not the primary key of the entity boat. Therefore, we allow for boat names to appear more than once so that different boats with the same name are identified in each query.
- Query D: in this query, besides showing the full name of all skippers without any certificate corresponding to the class of the trip's boat, we also show their email, so that (first\_name, surname, e-mail) is unique. This way, by showing DISTINCT values of (first\_name, surname, e-mail) we are allowing the situation of skippers without certifications with the same name but with different emails to be shown in the output and, at the same time, avoiding repetitions of the same person's name.
